AB Series

Industrial Air Curtains

AB industrial air curtains provide a barrier of high velocity air that helps block incoming winds and stops warm air escaping. They achieve this by delivering a powerful barrier of heated air across the entire width of the doorway. Units can be easily fitted within existing or new buildings and are ideal for open doorways.

Units are best mounted horizontally above the door to enable high-level warm air to be re-circulated to working level. Where over-door mounting is not possible, alternative units are

available which may be mounted vertically at one or both sides of the door.

Model Range

- Nine models, for door widths from 2 metres to 6.7 metres
- Suitable for doorways up to six metres high
- Heat outputs from 18 to 210 kW
- Choice of ambient, gas, electric or LPHW units
- Units may be specified for either use on natural gas (G20) or propane (G31)
- Standard units are suitable for horizontal mounting over the top of a door. For applications requiring vertical air curtains special 'tailor made' units are available

The Problem

When doors are opened in heated buildings, outside, colder, more dense air flows in through the bottom half of the door opening, whilst warm internal air flows out through the upper part of the doorway.

Conversely, in air-conditioned buildings or cold stores, the colder, more dense internal air spills out at low level and is replaced by warm, moist air.

Without air curtain

Features

- Lower energy bills; air curtains provide an effective barrier to minimise the loss of warm air through open doors
- Complement and improve efficiency of conventional heating systems
- Allow doors to be left open for fork lift access
- Heated units can operate when the door is closed to provide supplementary heating
- Models are supplied to site in modular format for ease of handling
- All models are supplied with remote control panels
- Optional fan speed control is available on all models

The Solution

The installation of an energy saving air curtain provides a barrier of air that defeats the natural convection airflow keeping conditioned air inside the building.

The AB designs provide air at a critical velocity, volume flow and temperature for optimum performance.

AB air curtains may be mounted horizontally or vertically to suit space or structure

Horizontal mounting

Vertical mounting

The Technology

In order to achieve efficient low energy solutions, the air jet width, velocity and pattern of the airflow is crucial. Reznor units incorporate the following design features for optimum performance:

- Uniform linear flow across the full door width
- Fan speed control with extra width adjustable air jet for improved wind resistance.

Installation considerations:

- Air curtains should be situated as close to the open door as possible
- The selected air curtain should be wider than the opening
- The air curtain should be commissioned to ensure the most efficient fan and heat settings are selected
